‘Marie Short House’ designed by Glenn Murcutt

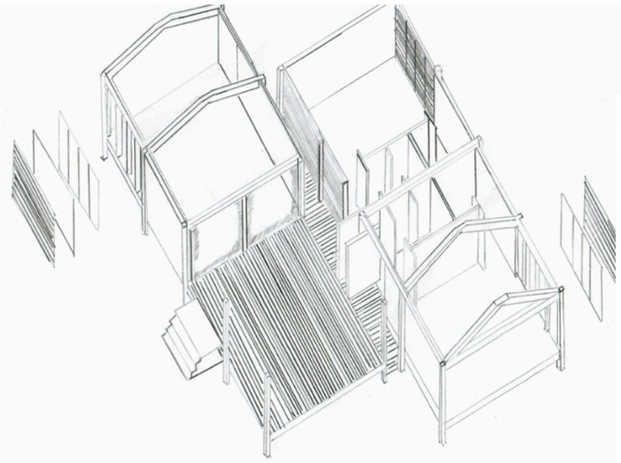

Located on a rural farmland within northern NSW, lies the famous **Marie Short House,** designed in the 1970s by architect **Glenn Murcutt**. The original house plans consist of two identical pavilions, one for sleeping purposes, and the other for living/recreational purposes. Each pavilion contains 6 structural bays, with the front and rear being an open alfresco area. The dwelling is constructed of beautiful local timbers, such as coachwood lining boards and tallowwood posts and beams. Murcutt later purchased the house in 1980 and added an addition three bays. The main features Murcutt designed the house around were a simple open floor plan, galvanized curved roof and around the natural landscape.

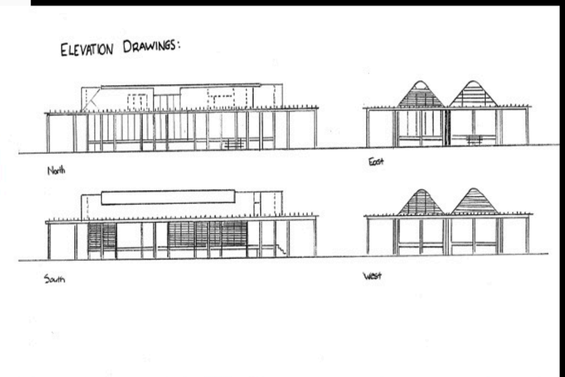

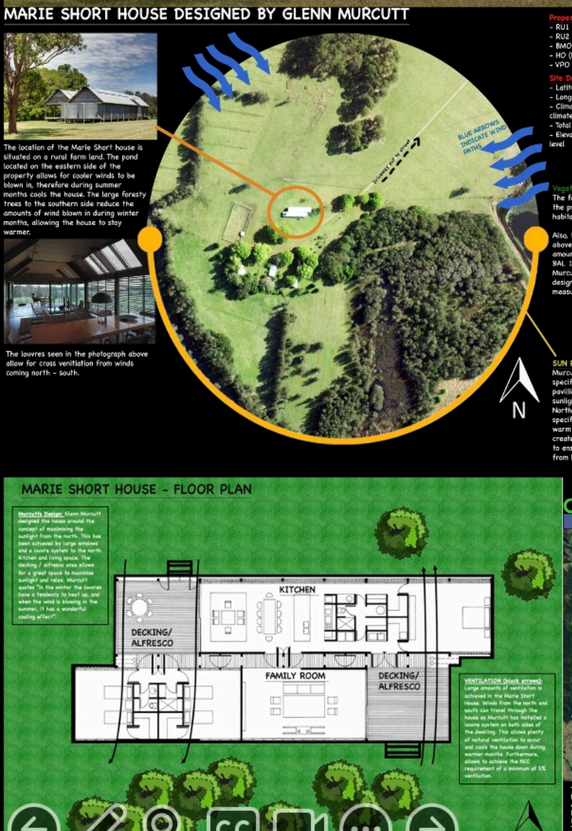

Glenn Murcutt was born in England in 1936 with two Australian parents, who later returned to Sydney in 1941. He studied architecture at the Sydney Technical College from which he completed and graduated in 1961. Murcutt operates as an individual practioner, designing many domestic and commercial buildings throughout Australia. Many of his projects adopted the motto “touch the earth lightly”, encouraging him to design his buildings around the natural environment, rather than destroying it. A testimony to his fantastic work, Murcutt won the Pritzker Architecture prize in 2002, and is one of Australia most influential and top architects.

Site Analysis

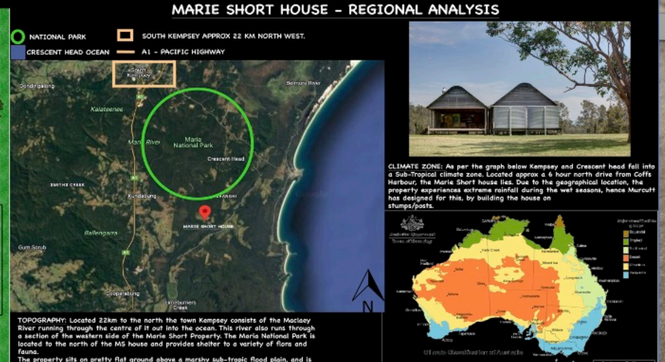

Property and planning overlays:
- RU1 (Primary Production)
- RU2 (Rural Landscape)
- BMO (Bushfire Prone Land)
- HO (Heritage Overlay)
- VPO (Vegetation Prone Overlay)

Site Details:
- Latitude: 31°04S.
- Longitude: 152°50E
- Climate Zone: Humid subtropical climate
- Total Area: 3,308km²
- Elevation: approx 10m above sea level

Vegetation:
The forestry vegetation surrounding the property allow for natural habitats for local wild life.

Also, the bushfire overlay indicated above, suggests due to the large amounts of trees that it may be a BAL 19 to BAL 40. Therefore, the Murcutt would have needed to design the house to these measures.

SUN PATH DETAILS:
Murcutt designed the house to a specific orientation. The living pavilion faces north to recieve sunlight for majority of the day. North facing windows haven been specifically placed to attract the warm sunlight. Furthermore, has created open farm land to the north to ensure no sunlight is blocked from large trees.

MARIKA-ALDERTON HOUSE
Eastern Arnhem Land, NT

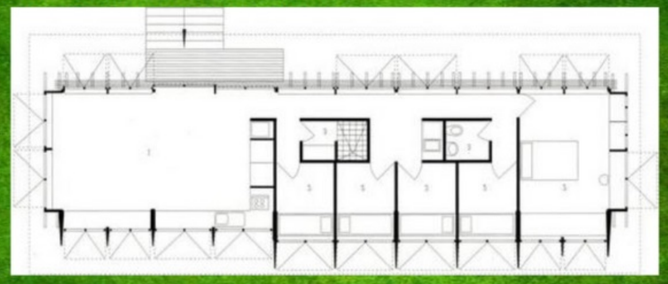

MARIKA-ALDERTON HOUSE – FLOOR PLAN

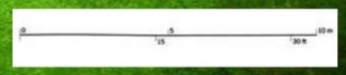

The house is located in Australia in the Yirrkala Community, Eastern Arnhem Land, Northern Territory (Yirrkala Community, Eastern Arnheim Land, Northern Territory). To the south and west of the house is the Mangrove forest and northward the Arafura Sea, location causing winds and strong tides, with minimum temperatures of 25 and maximum of 35 degrees and high humidity.

Being built in a rural Aboriginal, access to the house is by dirt roads or sea.

N

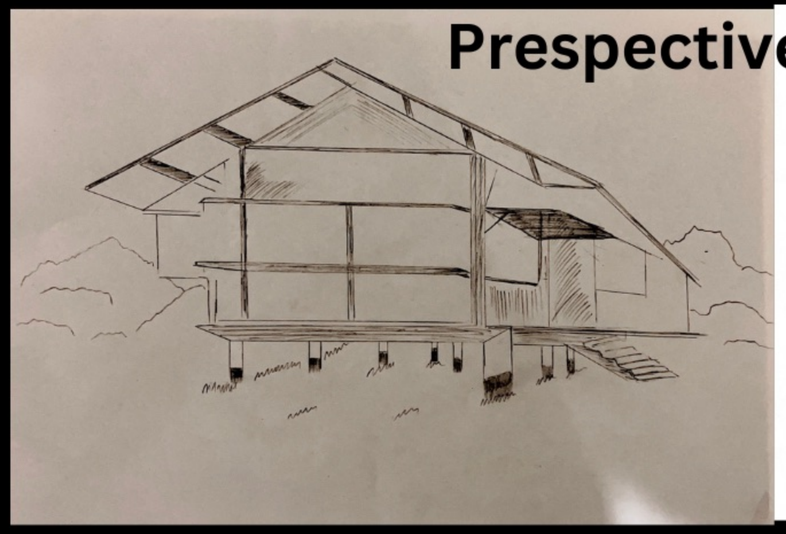

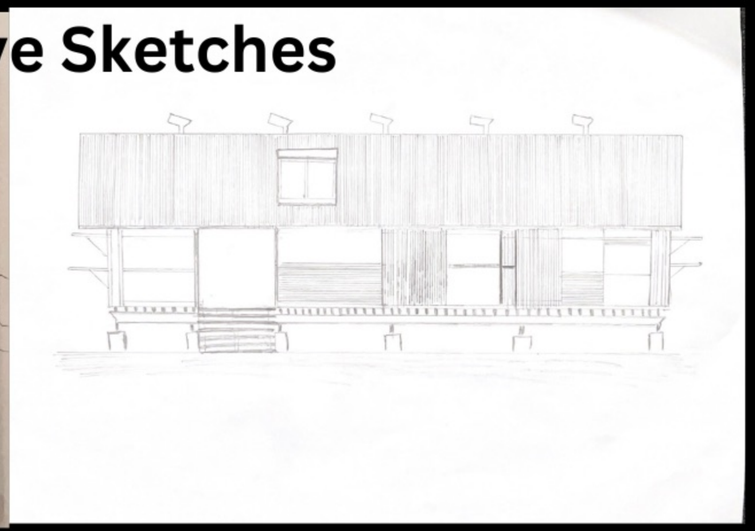

Access to the house is by the north, using some steps that save up on stilts.

The one-story house, elevated on stilts open in all directions and that is not a closed volume, but a shaded platform, with all kinds of racks, spoilers and brise soleil, without glass windows. Instead, the house has shutters that slope down to provide additional shade when necessary, also let in light and air flow when open. All rooms except the bathrooms enjoy all the headroom available.

Walsh House

The waslh house is located in Kangaroo valley nsw , the house is not conceived as one fluid interior space but as a series of connected rooms which allows the user to individually adjust the daylighting of thier room. The South and west sides have few windows and can be seen as a farm house type of constrution , while the north and east represent a moder more luxurious style
